1.BOM

1.1. Window Object

1.1.1. Create a parent window that opens a flying child window. Hint: Start by creating a parent window that opens a child window.

Child window should always be on top view and moves up and down within boundaries of user screen.

Parent window should contain a button that stops child window movement.

1.1.2. Write a script that shows a “typing message” appearing in a new child window. The new window should close after few seconds of displaying your message.

1.1.3. Create a parent a window that opens a scrollable advertising child window.
